

Strings & String Methods

The methods that turn messy real-world text into something usable.

1 — .STRIP()

Remove leading/trailing whitespace.

```

s = "  Jordan  "
print(s.strip())
# output:
Jordan
```

2 — .LOWER() .UPPER()

Normalize case for comparisons.

```

s = "YES"
print(s.lower())
# output:
yes
```

3 — .TITLE()

Capitalize the first letter of each word.

```

s = "hello world"
print(s.title())
# output:
Hello world
```

4 — .LEN() & SLICING

Measure and grab pieces of a string.

```

s = "Hello, Python"
print(len(s))
print(s[0:5])
13 Hello
```

5 — .REPLACE() .SPLIT()

Transform and break apart strings.

```

s = "2026-06-01"
p = s.split("-")
# output:
['2026', '06', '01']
```

6 — .CENTER()

Pad a string to a set width.

```

t = "REPORT"
print(t.center(20, "="))
# output:
=====REPORT=====
```

MINI PROJECT

— Report Header Generator

Turn messy, inconsistent input into a clean, centered, formatted header automatically.

```

raw = "  quarterly sales report  "
clean = raw.strip().title()
print(clean.center(40, "="))
```
