

EP01: Your First Line of Code

print() · variables · f-strings · string multiplication

01 – PRINT()

print()

Outputs text or values to the terminal.
Your first tool for seeing what Python is doing.

```
print("Hello, world!")
print("My name is Jordan")
print(42)
```

```
# Output
Hello, world!
My name is Jordan
42
```

02 – VARIABLES

Variables

Store a value with a name. No type declaration needed.

```
name = "Jordan Avery"
age = 28
city = "Houston"
```

```
print(name)
print(age)
```

```
# Output
Jordan Avery
28
```

NAMING RULES

snake_case use underscores between words

no spaces first_name not first name

no numbers first name2 ok, 2name not ok

case-sensitive Name != name

03 – F-STRINGS

f-strings

Embed variables directly inside a string.
Prefix the string with f and wrap vars in {}.

```
name = "Jordan"
role = "data analyst"
```

```
# Old way (messy)
print("Hi " + name)
```

```
# f-string way
print(f"Hi {name}, you are a {role}")
```

```
# Output
Hi Jordan, you are a data analyst
```

04 – STRING MULTIPLICATION

String Multiplication

Repeat a string by multiplying it by a number.

```
line = "-" * 30
print(line)
```

```
title = "REPORT"
print(line)
print(title)
print(line)
```

```
# Output
-----
REPORT
-----
```

MINI PROJECT

Personal Intro Card Generator

Build a formatted intro card using print(),
variables, f-strings, and string multiplication.

COMMON MISTAKES

Missing quotes

```
print(Hello)
print("Hello")
```

Wrong brackets

```
print["Hello"]
print("Hello")
```

Undefined var

```
print(Name)
name = "Jordan"
print(name)
```

Space in var name

```
first name = "J"
first_name = "J"
```
